MADHYA PRADESH - 466114

November 2025

1. Project Overview

Hydration Coach is a simple Python-based tool that helps users track their daily water intake and stay hydrated. It calculates personalized water requirements based on factors like age, weight, and activity level, and sends friendly reminders to drink water throughout the day. The program also records user inputs and gives feedback on hydration progress. This makes it a helpful everyday companion for building healthy hydration habits.

- How It Works?

Hydration Coach collects basic user details like name, age, weight, and activity level to calculate a recommended daily water intake. It then tracks how much water the user drinks throughout the day and compares it with the target. The program sends periodic reminders to drink water using simple functions. Finally, it displays progress so users can maintain healthy hydration habits.

2. Problem Statement

People often forget to drink enough water throughout the day. Lack of hydration affects concentration, mood, and health. This project aims to solve the problem by calculating personalized water requirements and generating periodic reminders.

3. Functional Requirements

- Accept user data (name, weight, interval).
- Calculate water requirement in ml, litres, and ml remainder.
- Provide hydration reminders at defined time intervals.
- Display results clearly.
- Provide test cases for verification.

4. Non-functional Requirements

- Usability: Simple and readable for beginners.
- Reliability: Produces consistent output.
- Portability: Works on Google Colab, VS Code, or IDLE.
- Maintainability: Clean modular structure.

5. System Architecture

User → user_input.py → main.py → calculator.py → reminders.py → Output

6. Design Diagrams

Use Case Diagram

- User inputs details.
- System calculates water.
- System gives reminders.
- User views results.

Workflow Diagram

1. Start

2. Get user input

3. Calculate water

4. Show output

5. End

Sequence Diagram

User → Main → User_Input → Calculator → Reminders → Console Output

Class/Component Diagram:

hydration_coach (package)

- calculator.py
- reminders.py
- user_input.py
- main.py

ER Diagram:

(Not applicable – no database used.)

7. Design Decisions & Rationale:

Modular Approach: Easier debugging and readability.

Simple Dictionaries for User Data: Beginner-friendly.

Functions Instead of Classes: Reduces complexity.

No External Dependency: Ensures easy execution.

8. Implementation Details:

Variables, expressions, statements used throughout.

Tuple assignment in liters_and_ml ().

Conditionals validate input.

Modules interact via imports

All functions tested.

9.Screenshots/Results, flowchart

10.Testing Approach

Testing was conducted using two methods:

1. Manual Testing

Running main.py to verify correct flow of execution.

Checking console outputs for validity.

2. Functional Testing via Test Files

test_calculator.py tested:

Water calculation logic

Tuple output correctness

test_reminders.py tested:

Reminder formatting

Both test files were executed individually to check whether module imports and calculations worked correctly.

11. Challenges Faced

- Module Import Errors: VS Code initially showed errors due to incorrect folder navigation.
- Package Structure Issues: Test files could not detect hydration_coach without correct directory structure.
- Google Colab Limitations: Colab required uploads and directory adjustments for modules to run.
- Name Error for _name: Incorrect use of _name caused runtime errors.

12. Learnings & Key Takeaways

- Learned how Python modules and packages work.
- Understood importance of _init_.py for package recognition.
- Practiced algorithm design, top-down design, and modular coding.
- Learned debugging skills for import paths.
- Understood how to run Python code in VS Code and Google Colab.

- Gained exposure to preparing documentation and flowcharts.

13. Future Enhancements

- Future improvements may include:
- Adding a graphical interface (Tkinter or Web App).
- Push notifications for reminders.
- User profiles stored in a database.
- Daily/weekly hydration analytics dashboard.
- Integration with fitness trackers.
